

LOCATION: 100-B(2)-*

HYDRAULIC CONDITIONS: Inconclusive

PERTINENT OBSERVATIONS: Extremely low water production

Drilled 100-B(2)-* to a total depth of 401'. No indication of water production observed in drilling fluid discharge while drilling to **T.D.** ~~no~~ water detected in borehole with water probe at T.D. after overnight recovery. The aquifer is fractured Orejon Andesite, but fracture **porosity** in this area does not appear very effective. Water level rose 28' in **18** days (**see** Well Summary sheet for details).
